#### HEMANGIOPERICYTOMA MEDIASTINALE – CASE REPORT

**Abstract:** Hemangiopericytoma is an uncommon potentially malignant tumor of vascular origin. We describe the clinical and morphologic features in a case of intrathoracic extrapulmonary giant hemangiopericytoma. The tumor was radically removed, and the microscopy report was malignant hemangiopericytoma. Because of the high risk of local recurrence, long-term follow-up is important in such patients.
